Context and objectives

Context: standard 1D Bin Packing (BP) under uncertainty

BP

A set V of items of different sizes ($w_i > 0$) have to be assigned to a minimum number of identical bins of capacity $W \geq \max_{i \in V} w_i$

Model of uncertainty

A given subset $\tilde{V} \subseteq V$ of item sizes have random deviations from their nominal values.

Application examples

- ▶ Hospital administration (Cardoen et al., 2010; Lamiri et al., 2008).
- ▶ Logistics capacity planning (Crainic et al., 2016).
- ▶ Assembly balancing (Boysen et al., 2007; Battaïa and Dolgui, 2013).

Considered robust BP variants

Stability radius calculated for the ℓ_∞ norm: $RBP_\infty(r)$

Each uncertain size can be increased by a maximum of r .

Relative resiliency: $RBP_{rr}(\alpha)$

Each uncertain size w_i can be increased by a maximum of αw_i

Stability radius calculated for the ℓ_1 norm: $RBP_1(r)$

The sum of the size increases over \tilde{V} is at most r .

Objectives of the study

- ▶ Solve to optimality these robust variants of BP .
- ▶ Investigate what protection against uncertainty is offered.
- ▶ Evaluate the cost of robustness.

Presentation plan

Context and objectives

Literature review

A Branch-and-Price algorithm

Numerical results

Conclusion and perspectives

Literature review

Column generation for BP under uncertainty

Robust machine availability problem (Song et al., 2018)

- ▶ Budgeted uncertainty (Bertsimas and Sim, 2004).
- ▶ Set-cover reformulation, Branch-and-Price algorithm (B&P)
 - ▶ Master problem: selection of filled bin patterns (set cover problem).
 - ▶ Pricing sub-problem : generation of filled bin patterns (knapsack-like problem).
- ▶ Can handle instances with up to 180 items with limited uncertainty within 1200 seconds.

Cutting stock with random demand (Alem et al., 2010)

- ▶ Two stage stochastic non-linear program.
- ▶ Column generation based heuristics.

Selected previous B&P algorithms

Focus on Ryan and Foster branching

Branch on a fractionally packed pair of items, so that they are:

1. in the same bin \rightarrow standard Knapsack (*KS*) sub-problem,
2. in two different bins \rightarrow *KS* with conflicts sub-problem.

Previous studies with this branching scheme

Study	Uncertainty	Node selection	<i>KS</i> with conflicts
Vance et al. (1994)	No	No conflicts first	MILP solver
Gamrath et al. (2016)	No	Integer feasibility, objective function	MILP solver
Song et al. (2018)	Budgeted	?	Binary decision diagrams

A Branch-and-Price algorithm

Compact formulations

Stability radius calculated for the l_∞ norm: $RBP_\infty(r)$

$$\min \sum_{k \in K} y_k \quad (1a)$$

$$\text{s.t. } \sum_{k \in K} x_{ik} \geq 1, \quad \forall i \in V, \quad (1b)$$

$$\sum_{i \in \tilde{V}} (w_i + r)x_{ik} + \sum_{i \in V \setminus \tilde{V}} w_i x_{ik} \leq W y_k, \quad \forall k \in K, \quad (1c)$$

$$y_k \in \{0, 1\}, \quad \forall k \in K, \quad (1d)$$

$$x_{ik} \in \{0, 1\}, \quad \forall i \in V, \quad \forall k \in K. \quad (1e)$$

Relative resiliency: $RBP_{rr}(r)$

Constraints (1c) are replaced by:

$$\sum_{i \in \tilde{V}} w_i (1 + \alpha) x_{ik} + \sum_{i \in V \setminus \tilde{V}} w_i x_{ik} \leq W y_k, \quad \forall k \in K.$$

Observation

Solving $RBP_\infty(r)$ or $RBP_{rr}(r)$ reduces to solving BP .

Compact formulations

Stability radius calculated for the ℓ_1 norm: $RBP_1(r)$

$$\min \sum_{k \in K} y_k \quad (2a)$$

$$\text{s.t.} \quad \sum_{k \in K} x_{ik} \geq 1, \quad \forall i \in V, \quad (2b)$$

$$x_{ik} \leq a_k, \quad \forall i \in \tilde{V}, \quad \forall k \in K, \quad (2c)$$

$$\sum_{i \in V} w_i x_{ik} + r a_k \leq W y_k, \quad \forall k \in K, \quad (2d)$$

$$y_k \in \{0, 1\}, \quad \forall k \in K, \quad (2e)$$

$$a_k \in \{0, 1\}, \quad \forall k \in K, \quad (2f)$$

$$x_{ik} \in \{0, 1\}, \quad \forall i \in V, \quad \forall k \in K. \quad (2g)$$

Observation

- ▶ $RBP_1(r)$ is a generalization of BP .
- ▶ An algorithm for $RBP_1(r)$ can also solve BP , $RBP_\infty(r)$ and $RBP_{rr}(\alpha)$

Set-cover reformulation

Master problem: selection of filled bin patterns

$$\min \sum_{B \in \mathcal{B}} \lambda_B \quad (3a)$$

$$\text{s.t.} \quad \sum_{B \in \mathcal{B}} x_i^B \lambda_B \geq 1, \quad \forall i \in V, \quad (3b)$$

$$\sum_{B \in \mathcal{B}} \lambda_B \leq K \quad (3c)$$

$$\lambda_B \in \{0, 1\}, \quad \forall B \in \mathcal{B}. \quad (3d)$$

Pricing sub-problem: generation of filled bin patterns

$$\max \sum_{i \in V} \pi_i x_i \quad (4a)$$

$$\text{s.t.} \quad x_i \leq a, \quad \forall i \in \tilde{V}, \quad (4b)$$

$$\sum_{i \in V} w_i x_i + ra \leq W, \quad (4c)$$

$$x_i \in \{0, 1\}, \quad \forall i \in V, \quad (4d)$$

$$a \in \{0, 1\}. \quad (4e)$$

Sub-problems without conflict

Property

The pricing sub-problem without conflict can be solved in $\mathcal{O}(n \cdot W)$, by solving two instances of the 0-1 knapsack problem.

→ Two calls to the Combo algorithm (Martello et al., 1999):

- ▶ one for the case without uncertain-sized item (*i.e.* $a = 0$)
- ▶ one for the case with uncertain-sized items (*i.e.* $a = 1$)

Sub-problems with conflicts

Property

The pricing sub-problem with conflicts can be solved by addressing two instances of the 0-1 knapsack problem with conflicts.

→ Two calls to a dedicated branch-and-bound algorithm (Sadykov and Vanderbeck, 2013).

Property (Dominance rule)

Let $C_i \subset V$ be the set of conflicting items with $i \in V$, i.e., for each $j \in C_i$ we have $x_i + x_j \leq 1$. If the following four conditions hold for some $j \in C_i$, then item j is "dominated" by item i , and can be removed from the instance of the robust 0-1 knapsack problem with conflicts:

1. $i \notin \tilde{V}$ or $j \in \tilde{V}$
2. $\pi_i \geq \pi_j$,
3. $w_i \leq w_j$,
4. $C_i \setminus \{j\} \subseteq C_j \setminus \{i\}$.

Primal heuristics

Adapted First-Fit Decreasing heuristic (FFD)

1. First pack uncertain-sized items with FFD:
Bins capacity is $W - r$
2. Then pack remaining items with FFD:
All extra bins have capacity W

Integer programming based heuristics

- ▶ Simple rounding,
- ▶ One-opt,
- ▶ ZI Round.

Numerical results

Settings

- ▶ The branch-and-price algorithm is implemented in C.
 - ▶ SCIP Optimization Suite 7.0.2 framework.
 - ▶ IBM CPLEX 12.8 simplex.
- ▶ Experiments were run on an Intel Core i7-6700HQ processor at 2.6 GHz with 4 GB of RAM
- ▶ Depth first search was in use, restarted from the best-bound node every 100 nodes.

	30%	11.54%
	50%	19.47%

Table 3: Extra cost for robustness increasing relative resiliency, for $RPB_{rr}(\alpha)$

Conclusion and perspectives

Conclusion

- ▶ Three robust variants of BP with items of uncertain size.
- ▶ One set-cover reformulation valid for the three robust variants.
- ▶ The proposed branch-and-price algorithm is able:
 - ▶ to obtain an optimal solution to every instance of $RBP_{\infty}(r)$ and $RBP_{rr}(\alpha)$, on average in less than three seconds per instance,
 - ▶ to obtain a proven optimal solution to 91% of $RBP_1(r)$ instances and to obtain a solution either optimal or requiring one extra bin to the remaining ones, on average in less than one minute.
- ▶ The extra cost for robustness ranged from 2% to 146% extra bins, depending on the robust approach, the percentage of uncertain items, and the value of r or α .
- ▶ We observed that standard BP provides solutions with a feasibility probability always close to 0, and that the proposed approaches provide the expected protections against uncertainty.

Perspectives

- ▶ Different robustness models:
 - ▶ For example uncertain bins, in which all item sizes can deviate.
 - ▶ Different kinds of uncertainties, affecting different subsets of items.
- ▶ Improvement of the branch-and-price algorithm:
 - ▶ Acceleration of the lower bound evaluation
 - ▶ Improvement of this lower bound.
 - ▶ Design of primal heuristics.
